High-Yield Investments

- High-yield bonds occupy a special capital market niche: They have offered better risk-adjusted returns than equities and lower interest-rate sensitivity than the broad fixed-income market.
- To date, high-yield bonds have been less vulnerable to the adverse effects of rising rates than other fixed-income sectors and have provided positive total returns in rising rate markets.
- Adding high-yield bonds to a broad fixed-income allocation has improved portfolio efficiency, based on 10-year hypothetical performance of blended portfolios.
- Recent problems in the energy sector sparked a broad sell-off of high yield, resulting in value opportunities for investors with the expertise and diligence to select quality issuers.

Exhibit A High-yield bonds have had equity-like returns with lower risk.

10 years ended 31 March 2016.	Return	Standard Deviation	Sharpe Ratio
BofA/Merrill Lynch US High-Yield Master II Index	6.9%	10.6%	0.54
S&P 500 Index	7.0%	15.3%	0.28

Why allocate to high-yield bonds?

High-yield bonds occupy a special capital market niche. As obligations of companies with below-investment-grade credit ratings, they offer higher yields to compensate investors for accepting additional credit risk. Generally, the lower the bond rating, the higher the yield.

To date, high-yield bonds have offered better risk-adjusted returns than equities and lower interest-rate sensitivity than the broad fixed-income market. Points to consider:

Better risk-adjusted returns than stocks

Over the past decade, high-yield bonds have produced essentially the same total return as stocks, with about two-thirds of the volatility, resulting in a higher Sharpe Ratio (Exhibit A).

Lower interest-rate sensitivity than bonds

The high income stream from high-yield bonds helps lower their duration compared with broad investment-grade indices like the Barclays Global Aggregate Index and other fixed-income sectors. High-yield bonds have the highest yield per unit of duration of all sectors (except floating-rate loans, which yield less) (Exhibit B).

Positive performance in rising rate markets

Rising rates are often an indicator of a strengthening economy. Because high-yield bonds are proxies for the credit strength of lower-rated companies, bond prices often move in tandem with equities. For example, over the 20 years ended 31 March 2016, during periods when 5-year U.S. Treasury yields gained 70 basis points (bps) or more in three months, high-yield bonds have averaged a gain of 2.5%, compared with a 3.0% return for the S&P 500 and a loss of 1.4% for investment-grade bonds, according to JPMorgan.

Even during the weak part of economic cycles, a diversified portfolio of high-yield bonds, like the JPMorgan Domestic High-Yield Index, has shown resilience. Over the past 35 years, the JPMorgan Index has had just five years with negative total returns, compared with seven for the S&P 500.¹

Improving fixed-income portfolio efficiency

The unique attributes of high-yield bonds have resulted in performance with low correlation to other fixed-income asset classes. For example, Exhibit C shows that the Barclays U.S. High-Yield Index has been just 0.37 correlated with the

high-yield sector in 2015 that has carried over into early 2016. As is often the case when broad market sentiment reaches a negative extreme, even bond prices of issuers with strong fundamentals have been driven below what we consider to be fair value, with a corresponding

widening of spreads relative to U.S. Treasurys. As of 31 March 2016, the spread on the Barclays U.S. High-Yield Index was 656 bps – 112 bps above its 10-year median. The yield to maturity was 8.2%.

Exhibit E shows that among major fixed-income sectors

Exhibit E High yield appears cheap relative to its history and other bond sectors.

high-yield valuation on 31 March 2016 was the “cheapest,” based on median spread levels, relative to its history and other bond sectors.

High yield has a history of strong rebounds

The history of high-yield bonds has taught us that patience is often rewarded. Exhibit F shows 31 instances since 1988 (when high-yield spreads were first tracked) through 31 March 2016 in which spreads were about as wide as they were on that date (plus or minus 50 bps)².

Annualised total returns for the three subsequent years ranged from 5.7% to 19.4%, with a median of 11.7%.

With high-yield defaults averaging about 2% over past 10 years and recovery rates of about 40%, exposure to credit loss would be about 120 bps per year on average. That leaves a considerable total return cushion if the default rate rises in the coming year – something we expect, given that 15% of the asset class is exposed to the energy, metals and mining sectors.

Worries about the energy sector and credit quality that have helped drive the high-yield sell-off are legitimate concerns. However, the market is already discounting default rates that are several times the current level.

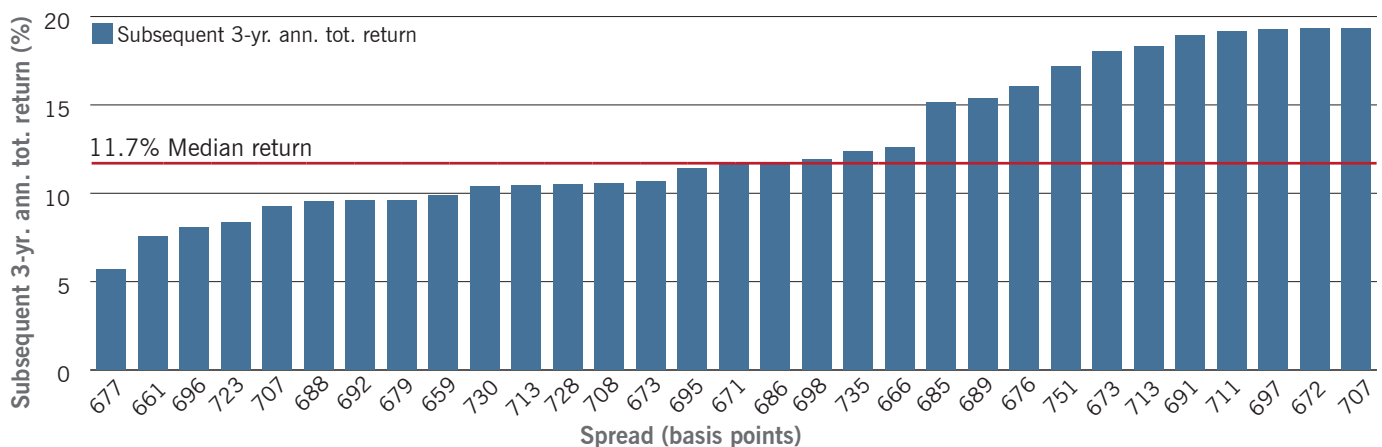

Eaton Vance’s approach to high yield

The recent sell-off in high-yield bond underscores the need for professional expertise and due diligence across the entire credit cycle – the key to maximising potential return in the sector, while seeking to minimise volatility.

Eaton Vance has a 32-year track record of managing high-yield investments and delivering solid risk-adjusted returns. Our principal high-yield strategies rank in the top quintile of managers over 1-, 3-, 5- and 10-year periods, based on eVestment Alliance rankings as of 31 March 2016.

This track record has been achieved through:

Exhibit F When high-yield bonds have gotten this “cheap,” investors have been rewarded. Since 1988, there have been 31 times when the HY spread was +/- 50 bps of the 705-bps spread on 31 March 2016.

Sources: Morningstar, BofA/Merrill Lynch as of 31 March 2016, based on monthly data. Data are provided for informational use only. Returns are based on the BofA/Merrill Lynch US High-Yield Master II Index. Past performance is no guarantee of future results. See end of report for important additional information.

²The range of +/- 50 bps represents about 10% of one annualised standard deviation.

- Continuity and consistency as hallmarks of our leadership and investment process.
- Capitalising on inefficiencies in the high-yield bond market through rigorous fundamental credit research and market factor analysis.

- Attention to risk-adjusted metrics and the goal of maintaining strong risk-adjusted returns throughout market cycles.

It would be our privilege to discuss with you how the Eaton Vance approach to high-yield investing may help your portfolio achieve its investment goals.

Index Definitions

Barclays U.S. Aggregate Bond Index is an unmanaged index of U.S. investment-grade bonds, including corporate, government and mortgage-backed securities.

Barclays Global Aggregate Ex-USD Index is a broad-based measure of global investment-grade fixed-rate debt investments, excluding USD-denominated debt.

Barclays U.S. Corporate High-Yield Index measures USD-denominated, noninvestment-grade corporate securities.

Barclays U.S. Corporate Investment Grade Index is an unmanaged index that measures the performance of investment-grade corporate securities within the Barclays U.S. Aggregate Bond Index.

Barclays U.S. Mortgage Backed Securities (MBS) Index measures agency mortgage-backed pass-through securities issued by GNMA, FNMA and FHLMC.

Barclays U.S. Agency Index measures agency securities issued by U.S. government agencies, quasi-federal corporations, and corporate or foreign debt guaranteed by the U.S. government.

Barclays U.S. Treasury Index measures securities issued by the U.S. government.

S&P/LSTA Leveraged Loan Index is an unmanaged index of the institutional leveraged loan market.

S&P 500 Index is an unmanaged index of large-cap stocks commonly used as a measure of U.S. stock market performance.

JPMorgan Emerging Markets Bond Index Plus (EMBI+) is a market cap-weighted index that measures USD-denominated Brady Bonds, Eurobonds and traded loans issued by sovereign entities

JPMorgan Domestic High-Yield Index is designed to mirror the investable universe of the U.S. dollar domestic high-yield corporate debt market.

BofA/Merrill Lynch High-Yield Master II Index measures USD-denominated, noninvestment-grade corporate securities.
